

# SET-TIME

Set time is a range of simple effective and easy to use time delay switches. The units can be used to control most types of electrical loads, for example heating, lighting or ventilation. Considerable energy savings can be made as the units automatically switch off after the chosen delay.

## Standard Housing

The set-time switch range are housed in single gang switch plates and are therefore suitable for most existing installations.

## Adjustable Timers

Depending on the unit the time delays are:-

ST2 range from 1 minute to 2 hours  
STNN range from 10 seconds to 20 minutes

## No neutral versions

The STNN range does not require a neutral and is therefore an easy to install light switch replacement.

## Illuminated Switch

Versions are available with illuminated fronts.
